

Table of Contents

1	Introduction to Operating systems
	<ul style="list-style-type: none"> • Basic Terminology & Definitions System, kernel, shell, program, hardware, software, system software, user applications, elements of computing system, operating systems, main memory, secondary memory, system call, multiprogramming, multiprocessing, timesharing, uniprocessor system, multiprocessor systems, file, process, interrupt, batch processing systems • Operating System Objectives and functions, issues in resource management • Operating system evolution Generation of computers, advancements in OS development, Serial Processing, Simple Batch Systems, Multiprogrammed Batch Systems, Time-Sharing Systems • Operating system structure monolithic and layered structure , microkernel architecture, UNIX system architecture, block diagram of system kernel, OS design hierarchy, General structure of Os control tables, characteristics of modern OS, SMP • Summary of System calls System calls for process management, device management, file management, time management, signaling, protection
2	Process
	<ul style="list-style-type: none"> • Basic Terminology & Definitions Task, program, process, thread, job, process state, process state transitions, process scheduling, process context, process mode, event, ready queue, blocked queue, suspended queue, resource, degree of multiprogramming, process priority, I/O scheduling, preemption, preemptive, nonpreemptive, process states • State Transition Models And Process Life Cycles Two state model, five state model, seven state model, eleven state model, Phases in and reasons of Process creation, suspension, termination • Process Management PCB, Process image, mode switch Vs context switch • Threads Thread management, ULT, KLT, process switch Vs thread switch, • System Calls For Process Management Fork, kill, signal, exec, wait, exit, getpid, getppid, nice, brk • Process scheduling Types of schedulers: Mid term-short term-long term schedulers, response time, waiting time, turnaround time, scheduling policies, uniprocessor scheduling, multiprocessor scheduling, real time scheduling, UNIX scheduling, LINUX scheduling, Comparative assessment of scheduling • Processes in Unix, Solaris and windows 2000 thread and SMP Management.

	<ul style="list-style-type: none"> • Multiple Choice Questions
3	Process Concurrency
	<ul style="list-style-type: none"> • Basic Terminology & Definitions Concurrency, Process synchronization, Mutual Exclusion, Race Condition, Critical Section, Data Coherence, Deadlock, Livelock, starvation, atomic operation, busy waiting, Semaphore, Monitor, message passing, mutex, • Principles, Approaches and Requirements process computation synchronizations, properties of Critical Section implementation, solution mechanisms to achieve concurrency, requirements for mutual exclusion, design issues for concurrency. • Software Approaches Dekker's solution, Peterson's solution, Comparison of both solutions • Hardware Approaches Interrupt disabling, special instructions • Support from Operating systems and Programming Languages Semaphores, Monitors, Message passing • Concurrency Mechanisms in different OS Concurrency in Unix, Solaris and windows • Solutions To Classical Problems Solutions to producer-consumer problem, readers-writers problem, sleeping barbershop problem using semaphore, monitors and message passing • Multiple Choice Questions
4	Deadlock
	<ul style="list-style-type: none"> • Basic Terminology & Definitions Deadlock, livelock, starvation, resource allocation graph • Conditions To Deadlock, Approaches To Deadlock Mutual exclusion, hold and wait, no preemption, circular wait, deadlock prevention, avoidance, detection and recovery, Ostrich Algorithm • Deadlock Prevention Solutions and demerits of the solutions for the conditions Mutual exclusion, hold and wait, no preemption, circular wait • Deadlock Avoidance Process initiation denial, resource allocation denial, banker's algorithm, safe-unsafe state • Deadlock Detection And Recovery Detection algorithm, resource category, solutions to every category, integrated deadlock strategy • Dining philosophers problem • Solved problems Problems on process initiation denial, resource allocation denial, detection algorithm, determine if the states are safe or unsafe. • Multiple Choice Questions • Exercise
