PHARMACOLOGY NOTES

NURSING IMPLICATIONS FOR CLINICAL PRACTICE

Overview

There are currently nine (9) units comprising this *Pharmacology Notes* resource. Units are broken down by body system and published individually for ease of retrieval:

Unit A: Autonomic Nervous System (ANS) Pharmacology

Unit B: Cardiovascular (CV) System Pharmacology

Unit C: Hematological System Pharmacology

Unit D: Central Nervous System (CNS) Pharmacology

Unit E: Skeletal System: Bone and Joint Pharmacology

Unit F: Immune System Pharmacology

Unit G: Digestive System Pharmacology

Unit H: Endocrine System Pharmacology

Unit I: Respiratory System Pharmacology

Common License: Pharmacology Notes: Nursing Implications for Clinical Practice by Gloria Velarde is licensed under a Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International License.

Cardiovascular (CV) System

Anatomy and Physiology/Pathophysiology Review

Factors Affecting Cardiac Output (CO)

Blood Pressure Regulation

Cholesterol Synthesis

Common CV Disorders

Hypertension (HTN)

Coronary Artery Disease (CAD)

Cardiac Dysrhythmias/Arrhythmias

Heart Failure (HF)

Pharmacology

Pharmacologic Connections for CV Agents

Drug Classes: A-T-A-T

(MC) Major Class or Therapeutic Class
(SC) Subclass or Pharmacologic Class
(SSC) Selective Subclass – more specific action within Subclass

(MC) Antihypertensives

(SC) Diuretics

(SC) Angiotensin Converting Enzyme Inhibitors (ACEIs)

(SC) Angiotensin II Receptor Blockers/Antagonists (A2RBs)

(SC) Renin Inhibitors

(SC) Calcium Channel Blockers (CCBs)

(SC) Alpha₁ (α_1) Adrenergic Blockers/Antagonists

(SC) Alpha₂ (α_2) Adrenergic Agonists

(SC) Beta Adrenergic Blockers/Antagonists (BBs)

(SC) Miscellaneous Vasodilators

(MC) Antianginals

(SC) Beta Adrenergic Blockers/Antagonists (BBs)

(SC) Calcium Channel Blockers (CCBs)

(SC) Nitrates

(SC) Angiotensin Converting Enzyme Inhibitors (ACEIs)

(SC) Angiotensin II Receptor Blockers/Antagonists (A2RBs)

(SC) Renin Inhibitors

(SC) Angiotensin Receptor – Neprilysin Inhibitors (ARNIs)

(MC) Antidysrhythmics

(SC) Sodium (Na^+) Channel Blockers

(SC) Beta Adrenergic Blockers/Antagonists (BBs)

(SC) Potassium (K^+) Channel Blockers

(SC) Calcium Channel Blockers (CCBs)

(SC) Other Antidysrhythmics

(SSC) Cardiotonics/Cardiac Glycosides

(MC) Antilipidemics

(SC) Hydroxymethylglutaryl – Coenzyme A Reductase Inhibitors (HMG-CoA)
Reductase Inhibitors

(SC) Cholesterol Absorption Inhibitors

(SC) Fibric Acid Agents or Fibrates

(SC) Bile Acid Resins or Sequestrants

(SC) Nicotinic Acid

Cardiovascular (CV) System Pharmacology

I. ANATOMY AND PHYSIOLOGY/PATHOPHYSIOLOGY REVIEW

A. Factors Affecting Cardiac Output (CO): CO is a product of stroke volume (SV) and heart rate (HR)

$$\text{CO} = \text{SV} \times \text{HR}$$

1. Stroke Volume is affected by:
 - a. Preload: The amount of tension or stretch, in the ventricles right before contraction (or end-diastolic volume).
 - Influenced by: overall blood volume, venous blood return
 - b. Afterload: The force or pressure the ventricles must exert or overcome to eject the blood out.
 - Influenced by: cardiac size, peripheral vascular resistance
 - c. Contractility: The force with which ventricular ejection occurs; the ability of the ventricles to squeeze those ventricles with each beat.
 - influenced by: muscle condition, strength
2. Heart Rate is affected by:
 - a. Autonomic nervous system (ANS): SNS and PNS
 - b. Fluid volume
 - c. Activity/exertion

B. Blood Pressure (BP) Regulation: is a product of blood volume (BV) or fluid volume (FV) or cardiac output (CO) and peripheral vascular resistance (PVR)

$$\text{BP} = \text{BV (or FV or CO)} \times \text{PVR}$$

1. $\uparrow \text{BV or } \uparrow \text{FV or } \uparrow \text{CO} \rightarrow \uparrow \text{BP}$
 $\downarrow \text{BV or } \downarrow \text{FV or } \downarrow \text{CO} \rightarrow \downarrow \text{BP}$
2. $\uparrow \text{PVR (vasoconstriction)} \rightarrow \uparrow \text{BP}$
 $\downarrow \text{PVR (vasodilation)} \rightarrow \downarrow \text{BP}$

C. Cholesterol Synthesis

1. Blood lipids/cholesterol is regulated by:
 - a. Endogenous factors – cholesterol synthesis in the body – primary site: LIVER
 - b. Exogenous factors – diet:
 - 1) \uparrow saturated fats/cholesterol $\rightarrow \uparrow$ blood lipid levels
 - 2) \uparrow polyunsaturated fats $\rightarrow \downarrow$ blood lipids levels
 - 3) \uparrow dietary fiber \rightarrow binds with bile acids and prevents reabsorption $\rightarrow \downarrow$ blood lipid levels

$$\text{Blood cholesterol} = \text{Rate of synthesis} - \text{rate of destruction (utilization and/or excretion/elimination)}$$

2. There are different types of lipoproteins, which contain varying amounts of cholesterol, triglycerides, and phospholipids and a protein carrier:
 - a. Low-density lipoproteins (LDL) and very low-density lipoproteins (VLDL) = "lousey" or "bad"
 - b. High-density lipoproteins (HDL) = "happy" or "good"

D. Common CV Disorders

1. Hypertension (HTN):
 - a. Description: high blood pressure; persistent elevation ≥ 130 systolic and/or ≥ 80 diastolic
 - b. Causes/Risk factors (primary or essential HTN):
 - 1) modifiable: smoking, obesity, diet, inactivity, dyslipidemia, DM, stress
 - 2) non-modifiable: family hx, race (African-American), age, gender
 - 3) s/sx: often asymptomatic
 - 4) consequences/complications: cardiac disease, stroke, renal disease, peripheral artery disease (PAD), blindness
2. Coronary Artery Disease (CAD):
 - a. Description: impedance or blockage of one or more arteries that reduces blood supply to heart
 - b. Causes/Risk factors:
 - 1) dyslipidemia \rightarrow atherosclerosis*
 - 2) HTN + others listed for HTN
 - c. Outcome:
 - 1) imbalance between oxygen supply and oxygen demand

$O_2 \text{ supply} \neq O_2 \text{ demand}$
 - 2) blood flow/supply is unable to meet cardiac workload

$BF/supply \neq \text{cardiac workload}$
 - d. Key s/sx:
 - 1) angina/chest pain*
 - 2) shortness of breath (SOB)
 - 3) GI sx
 - 4) myocardial infarction
3. Cardiac Dysrhythmias/Arrhythmias:
 - a. Description: abnormal heart rate and/or rhythm
 - b. Causes: ectopic foci or "extra" beat(s) due to \uparrow irritability or \uparrow excitability of the heart
 - c. Contributing/Risk factors: heart disease, electrolyte imbalances, conditions causing hypoxia (e.g. respiratory conditions); endocrine disorders (i.e. thyroid)
 - d. Outcome: \downarrow CO due to ineffective myocardial contractility $\Rightarrow \uparrow$ cardiac workload or \uparrow O_2 demand
 - e. S/sx: \downarrow CO or HF

4. Heart Failure = Sequelae or Consequences of ↓ CO:
 - a. Description: when heart (pump) no longer has the ability to provide adequate blood to the body
 - b. Causes: any CV condition or disease that ↓ CO (can be acute or chronic)
 - c. Outcome: ↓ forward blood flow and ↑ blood back up
 - d. S/sx:
 - 1) L-sided – ↓ blood delivered to periphery, kidneys, GI, heart, and ↑ blood back-up into lungs:
 - a) ↓ peripheral circulation, ↓ renal function, ↓ GI function, chest pain, fatigue
 - b) lung congestion
 - 2) R-sided – ↓ blood delivery to lungs; and ↑ blood back-up into venous system:
 - a) hypoxia
 - b) peripheral edema, + JVD, hepatic congestion, hepatomegaly, ascites

II. PHARMACOLOGY

A. Pharmacologic Connections for CV Agents

1. CV agents will act on one or more factors that affect cardiac output (CO = SV x HR)
⇒ **mechanism of action (MOA)** or pharmacodynamics
2. The goals of CV agents are to:
 - a. **Maintain** or attain adequate CO
 - b. **Restore** balance between O₂ supply and oxygen demand by:

O₂ Supply = O₂ Demand

 - 1) ↑ blood flow or supply by promoting vasodilation
 - 2) ↓ cardiac workload by ↓ HR and/or cardiac irritability or excitability
 - 3) when you think of **preload** and **afterload**, think cardiac workload
 - c. **Manage** BP by:
 - 1) ↓ blood volume **or** ↓ fluid volume **or** ↓ cardiac
 - 2) ↓ PVR
 - d. **Regulate** HR and rhythm by:
 - 1) ↓ ectopic beats →
 - 2) ↓ cardiac irritability/excitability →
 - 3) ↓ cardiac workload
 - e. In the presence of CV disease, the **goal** of several CV drugs is to **reduce** cardiac workload
3. The desired effects of CV agents are to:
 - a. ↓ s/sx of CV condition or disease
 - b. ↓ s/sx or prevent HF

4. Specific to lipid-lowering agents:
 - a. Blood cholesterol is managed by:
 - 1) ↓ cholesterol synthesis
 - 2) ↓ cholesterol absorption
 - 3) ↑ cholesterol excretion/elimination
 - b. Management is directed at:
 - 1) ↓ "bad" lipoproteins
 - 2) ↑ "good" lipoproteins

Nursing Implications: CV Pharmacology: Antihypertensives $BP = BV \text{ (or FV or CO)} \times PVR$

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – √ Therapeutic Effects – General (MC)	A – √ Adverse Effects – Common	A – √ Adverse Effects – Specific (SC)	T – Teaching – General
Diuretics	Blocks absorption of water → ↑ UO → ↓ FV → ↓ BP			Route: PO/IV; IV for rapid action Timing: early in day	Treatment of underlying causes of HTN (e.g. excess FV): • ↓ wgt, ↓ edema, ↓ lung congestion) Treatment of hypertension: • ↓ BP ↓ s/sx of HTN (HA, blurry vision) Ø signs of HTN-related complications: • CAD, CVD (neuro), PAD, renal, eyes	• CV: hypotension – dizziness, light-headedness, syncope, + orthostasis • Other: arrhythmias, angina, s/sx HF • GI: N/V/D/C • Sexual dysfunction	• <u>F&E</u> : dehydration, electrolyte loss/ imbalances, ↑ BG • Hypokalemia • ↑ hypokalemia; • ENT: ototoxicity, esp when given IV • Hyperkalemia • Dry mouth, excessive thirst, HA • Pulmonary congestion • Neuro: paresthesias, tinnitus • Hypersensitivity • Blood dyscrasias	Selection based on HTN class: • Timing: same time; stagger if >1 • Ø abruptly stop • Safety precautions • Ø excess alcohol • Ø hot weather • Lifestyle changes • ✓ BP & HR record SPECIFIC to diuretics: • Timing: Ø evening • ✓ wgt • Diet restrictions to ↓ excess FV (↓ Na ⁺) • Report: ○ Sudden wgt △'s ○ △'s HR or rhythm ○ ↑ breathing sx • ✓ electrolyte labs, CBC
	• thiazide	hydrochlorothiazide	HydroDiuril, Microzide					
	• loop	furosemide	Lasix					
	• K ⁺ sparing/ aldosterone antagonist	spironolactone	Aldactone					
	• osmotic	mannitol	Osmitrol					
	• carbonic anhydrase inhibitors	acetazolamide	Diamox	For acetazolamide: • Take 1-2 days before climbing (altitude sickness)	Other uses for acetazolamide: • Ø s/sx altitude sickness • ↓ IOP for glaucoma • ↓ or Ø seizure activity			

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – ✓ Therapeutic Effects – General (MC)	A – ✓ Adverse Effects – Common	A – ✓ Adverse Effects – Specific (SC)	T – Teaching – General
Angiotensin converting enzyme inhibitors (ACEIs)	Blocks enzyme that converts angiotensin I → angiotensin II → vasodilation → ↓ PVR → ↓ BP Blocks aldosterone secretion → ↑ UO → ↓ FV → ↓ BP	lisinopril fosinopril captopril	Prinivil, Zestil Monopril Capoten	Route: <u>PQ</u> for most; IV for rapid action	(See previous page)	(See previous page)	<ul style="list-style-type: none"> • Hyperkalemia • Hypersensitivity (rash) • Angioedema • Cough • Teratogenicity • GU: ↑ creatinine 	(See previous page) SPECIFIC to A2 subclasses: <ul style="list-style-type: none"> • Monitor electrolytes, esp. K⁺ • Contraception • Monitor renal function: BUN, Cr, EGFR • Teach re: use of salt substitutes
Angiotensin II receptor antagonists/ blockers (A2RBs)	Blocks action of angiotensin II after it's formed (outcome same as ACEIs)	losartan valsartan	Cozaar Diovan					
Renin inhibitors	Binds w/ renin → ↓ angiotensin II and aldosterone → ↓ PVR and ↓ FV → ↓ BP	aliskiren	Tekturna					
Calcium channel blockers (CCBs)	Blocks Ca ⁺⁺ channels in vascular smooth muscle walls → vasodilation → ↓ PVR → ↓ BP	nifedipine diltiazem verapamil amlodipine	Adalat, Procardia Cardizem Calan, Covera-HS, Isoptin SR Norvasc				<ul style="list-style-type: none"> • Bradycardia or reflex tachycardia • Constipation (primarily verapamil) 	SPECIFIC to CCBs: <ul style="list-style-type: none"> • Monitor bowel function – add fiber to diet

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – ✓ Therapeutic Effects – General (MC)	A – ✓ Adverse Effects – Common	A – ✓ Adverse Effects – Specific (SC)	T – Teaching – General
Alpha ₁ (α_1) adrenergic antagonists/ blockers	Blocks sympathetic receptors in arterioles → vasodilation → ↓ PVR → ↓ BP	prazosin doxazosin	Minipress Cardura	(See previous page)	(See previous page)	(See previous page)	<ul style="list-style-type: none"> • 1st dose syncope • CNS: nervousness, fatigue 	(See previous page)
Alpha ₂ (α_2) adrenergic agonists	Centrally-acting → ↓ SNS activity to heart & arterioles → vasodilation → ↓ PVR → ↓ BP	clonidine methyldopa	Catapres Aldomet				<ul style="list-style-type: none"> • Drowsiness, sedation, • Dry mouth • Rebound hypertension if abruptly stopped • Blood dyscrasias 	
Beta adrenergic antagonists/ blockers (BBs)	Blocks beta receptors in heart → ↓ CO → ↓ BP	metoprolol propranolol carvedilol	Lopressor, Toprol Inderal Coreg				<ul style="list-style-type: none"> • Bradycardia • Bronchospasms – use w/ caution w/ pts having COPD, asthma • Rebound tachycardia if abruptly stopped 	
Miscellaneous vasodilators	Relaxes smooth muscles in blood vessels → vasodilation → ↓ PVR → ↓ BP	nitroprusside sodium	Nitropress	Route: IV Used for: hypertensive crisis			<ul style="list-style-type: none"> • Fast, profound hypotension 	

Nursing Implications: CV Pharmacology: Antianginals (CAD/HF management) – Restore balance: O₂ supply = O₂ demand by:
↑ O₂ supply (blood flow) and/or ↓ O₂ demand (cardiac workload)

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – √ Therapeutic Effects – General (MC)	A – √ Adverse Effects – Common	A – √ Adverse Effects – Specific (SC)	T – Teaching – General
Beta adrenergic antagonists/ blockers (BBs)	Blocks beta receptors in heart → ↓ CO → ↓ cardiac workload → ↓ O ₂ demand	metoprolol propranolol carvedilol	Lopressor, Toprol Inderal Coreg	Subclasses given depends on goal of tx: short- or long-term mgmt. of chest pain Route: short-term: • SL, TL spray, ointment, IV Route: long-term: • PO, transdermal patch/disc Timing: same time; stagger w/ other anti-HTN meds	<ul style="list-style-type: none"> • Manage acute episode of chest pain • Manage long-term myocardial ischemia → ↓ episodes of acute chest pain • ↑ cardiac output: <ul style="list-style-type: none"> ○ improve activity level & tolerance 	<ul style="list-style-type: none"> • CV: hypotension – dizziness, light-headedness, syncope, + orthostasis • Other: arrhythmias, angina, s/sx HF 	<ul style="list-style-type: none"> • Bradycardia • Bronchospasms – use w/ caution w/ pts having COPD, asthma • Rebound tachycardia if abruptly stopped 	<ul style="list-style-type: none"> • Timing: same time; evenly spaced for long-acting • Ø abruptly stop • Safety precautions • Ø excess alcohol • Lifestyle changes – reinforce activity restrictions • ✓ BP & HR record • ✓ cardiac enzymes: troponin, CK, LDH, myoglobin
Calcium channel blockers (CCBs)	Blocks Ca ⁺⁺ channels in vascular smooth muscle walls → <ul style="list-style-type: none"> • vasodilation → ↑ blood flow → ↑ O₂ supply • ↓ BP → ↓ afterload → ↓ O₂ demand Blocks Ca ⁺⁺ influx into myocardial cells → ↓ cardiac excitability → ↓ cardiac workload → ↓ O ₂ demand	nifedipine verapamil amlodipine diltiazem	Adalat, Procardia Calan, Covera-HS, Isoptin SR Norvasc Cardizem			<ul style="list-style-type: none"> • GI: N/V/D/C 	<ul style="list-style-type: none"> • Bradycardia or tachycardia reflex • Constipation (primarily verapamil) 	

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – ✓ Therapeutic Effects – General (MC)	A – ✓ Adverse Effects – Common	A – ✓ Adverse Effects – Specific (SC)	T – Teaching – General
Nitrates	Relaxes both arterial & venous smooth muscles: <ul style="list-style-type: none"> arterial dilation → ↑blood flow → ↑O₂ supply venous dilation → ↑blood pools → ↓blood return → ↓preload → ↓cardiac workload → ↓O₂ demand 	nitroglycerin (NTG) isosorbide	Nitrostat, Nitrobid, Nitro-Dur Isordil	(See previous page)	(See previous page)	(See previous page)	<ul style="list-style-type: none"> CV: tachycardia, headache, peripheral edema 	SPECIFIC to short-acting NTG: <ul style="list-style-type: none"> Have pt. stop activity ✓ vs, pain level: NTG 1 tab SL every 5 min x 3 for chest pain PRN Storage: cool, out of light, replace q 24 months Avoid skin contact w/ NTG ointment/patches → headache Patches/ointment: apply to clean, dry, hairless areas; rotate sites, avoid distal portions Remove (12 hrs on/ 12 hrs off – ↓tolerance)
Angiotensin converting enzyme inhibitors (ACEIs)	Blocks enzyme that converts angiotensin I → angiotensin II → vasodilation → ↑ blood flow → ↑ O ₂ supply Blocks aldosterone secretion → ↑ UO → ↓ FV → ↓CO → ↓ cardiac workload → ↓ O ₂ demand	lisinopril fosinopril captopril	Prinivil, Zestil Monopril Capoten				<ul style="list-style-type: none"> Hyperkalemia Hypersensitivity (rash) Angioedema Cough Teratogenicity GU: ↑ Cr 	SPECIFIC to A2 subclasses: <ul style="list-style-type: none"> Monitor electrolytes, esp. K⁺ Monitor renal function: BUN, Cr, EGFR Teach re: use of salt substitutes Contraception

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – √ Therapeutic Effects – General (MC)	A – √ Adverse Effects – Common	A – √ Adverse Effects – Specific (SC)	T – Teaching – General
Angiotensin II receptor antagonists/ blockers (A2RBs)	Blocks action of angiotensin II after it's formed <i>(outcome same as ACEIs)</i>	losartan	Cozaar	(See previous page)	(See previous page)	(See previous page)	<ul style="list-style-type: none">• Hyperkalemia• Hypersensitivity (rash)• Angioedema• Cough• Teratogenicity• GU: ↑ Cr	SPECIFIC to A2 subclasses: <ul style="list-style-type: none">• Monitor electrolytes, esp. K⁺• Monitor renal function: BUN, Cr, EGFR• Teach re: use of salt substitutes• Contraception
Renin inhibitors	Binds w/ renin → ↓ angiotensin II & aldosterone <i>(outcome same as ACEIs)</i>	aliskiren	Tekturna					
Angiotensin receptor – neprilysin inhibitors (ARNIs)	Blocks action of angiotensin II after formed & inhibits neprilysin (enzyme that metabolizes peptides) → ↑ blood levels of natriuretic peptides: <ul style="list-style-type: none">• promotes renal excretion of sodium & water• promotes myocardial relaxation & inhibits hypertrophy & fibrosis• suppress SNS outflow in brain• stimulates vasodilation	valsartan/ sacubitril	Entresto		<ul style="list-style-type: none">• ↓ s/sx heart failure• improved ejection fraction			

Nursing Implications: CV Pharmacology: Anti-Dysrhythmics –
↓ ectopic foci → ↓ cardiac irritability/excitability (↓ O₂ demand/cardiac workload)

Subclass	MOA	Prototype – generic	Prototype – trade	A – Admin	T – √ Therapeutic Effects – General (MC)	A – √ Adverse Effects – Common	A – √ Adverse Effects – Specific (SC)	T – Teaching – General
Na ⁺ channel blockers (Class I A-C)	Blocks the movement of Na ⁺ (fast channels) into myocardial cells → delays depolarization → delays action potential → ↓ excitability	lidocaine procainamide propafenone	Xylocaine Pronestyl, Procanbid Rythmol	<ul style="list-style-type: none"> ✓ AP for one full minute <ul style="list-style-type: none"> HOLD if < 60 ✓ BP ✓ electrolyte levels <p>Timing: evenly spaced intervals; same time daily</p>	<ul style="list-style-type: none"> HR returned to baseline (60-100 beats per minute) Rhythm = regular No s/sx HF 	<ul style="list-style-type: none"> Dysrhythmias – most common = bradycardia △'s BP = hypotension S/sx of ↓ CO or HF (CO = SV x HR) 	<ul style="list-style-type: none"> CV: cardiotoxicity <ul style="list-style-type: none"> ↑ PR & QT intervals widening QRS complex MS: painful inflamed joints Heme: blood dyscrasias 	<ul style="list-style-type: none"> How to take pulse – one full minute Have BP monitored regularly Timing of medications esp. if taking more than one Safety re: position changes Follow-up labs <ul style="list-style-type: none"> electrolyte levels Report any worsening sx: SOB, CP, palpitations Use OTC cold remedies, appetite suppressants, & anti-sleep preparations w/ caution
Beta adrenergic antagonists/ blockers (BBs) (Class II)	Blocks beta receptors in heart → ↓ CO → ↓ excitability	metoprolol propranolol carvedilol	Lopressor, Toprol Inderal Coreg	<p>Contraindications: pregnancy, heart block</p>			<ul style="list-style-type: none"> Bradycardia Bronchospasms – use w/ caution w/ pts having COPD, asthma Rebound tachycardia if abruptly stopped 	
K ⁺ channel blockers (Class III)	Blocks movement of K ⁺ out of myocardial cells → prolongs repolarization → ↑ refractory period → ↓ cardiac excitability	amiodarone sotalol	Cordarone Betapace				<ul style="list-style-type: none"> Pulmonary toxicity Visual disturbances Liver/thyroid dysfunction GI sx CNS 	
Calcium channel blockers (CCBs) (Class IV)	Blocks Ca ⁺⁺ influx into myocardial cells → delays myocardial contraction that follows depolarization ↓ cardiac excitability	nifedipine verapamil diltiazem amlodipine	Adalat, Procardia Calan, Covera-HS, Isoptin SR Cardizem Norvasc				<ul style="list-style-type: none"> Bradycardia or reflex tachycardia Constipation (primarily verapamil)
